QR 7.3A – User Manual for BAC A Bank Kalypto/ConstaCheck (EWS)

1 Introduction

This document has been prepared based on the EWS system developed by CARE Edge Risk Solutions to be implemented at BAC A Bank, Vietnam with the objective of providing an understanding of the EWS system and its modules.

1.1 Purpose

The purpose of this document is to describe the working of ConstaCheck EWS System to the end user from a functional perspective. This document shall allow the user to understand the functioning of EWS system, setup of risk indicators, threshold limits, breach generation, workflow and other system associated details.

1.2 Scope

The document shall explain and cover the details of Kalypto/ConstaCheck EWS which facilitates pre-emptive risk management for individuals /companies as a part of the loan asset portfolio. The document shall cover about the major parts of the system such as configuration of applicable triggers with their threshold values, breach tracking, case management with Causal Analysis and Corrective Action Plan and Notification Management.

1.3 Definitions, Acronyms and Abbreviations

1.5 Overview

The following document has been prepared to cover the entire functionality of the Early Warning Signals platform to be implemented at BAC A Bank, Vietnam. The document has been prepared by CARE Edge Risk Solutions Pvt. Ltd., which is the vendor for the proposed implementation.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

2 Overall Description

BAC A Joint Stock Commercial Bank, commonly referred to as “BAC A BANK” or “BAB” or “the Bank”, is working with Ernst & Young Vietnam to implement a group of systems supporting risk management of the Bank, namely:

- Internal Rating System;
- Early Warning System;
- Operational Risk Management System;
- Market Risk Management System.

The document describes the functional requirement of the Kalypto/ConstaCheck, the EWS system to meet the Bank’s needs.

2.1 Project Perspective

The EWS system is expected to interface with the following systems to get data and load back results, if required.

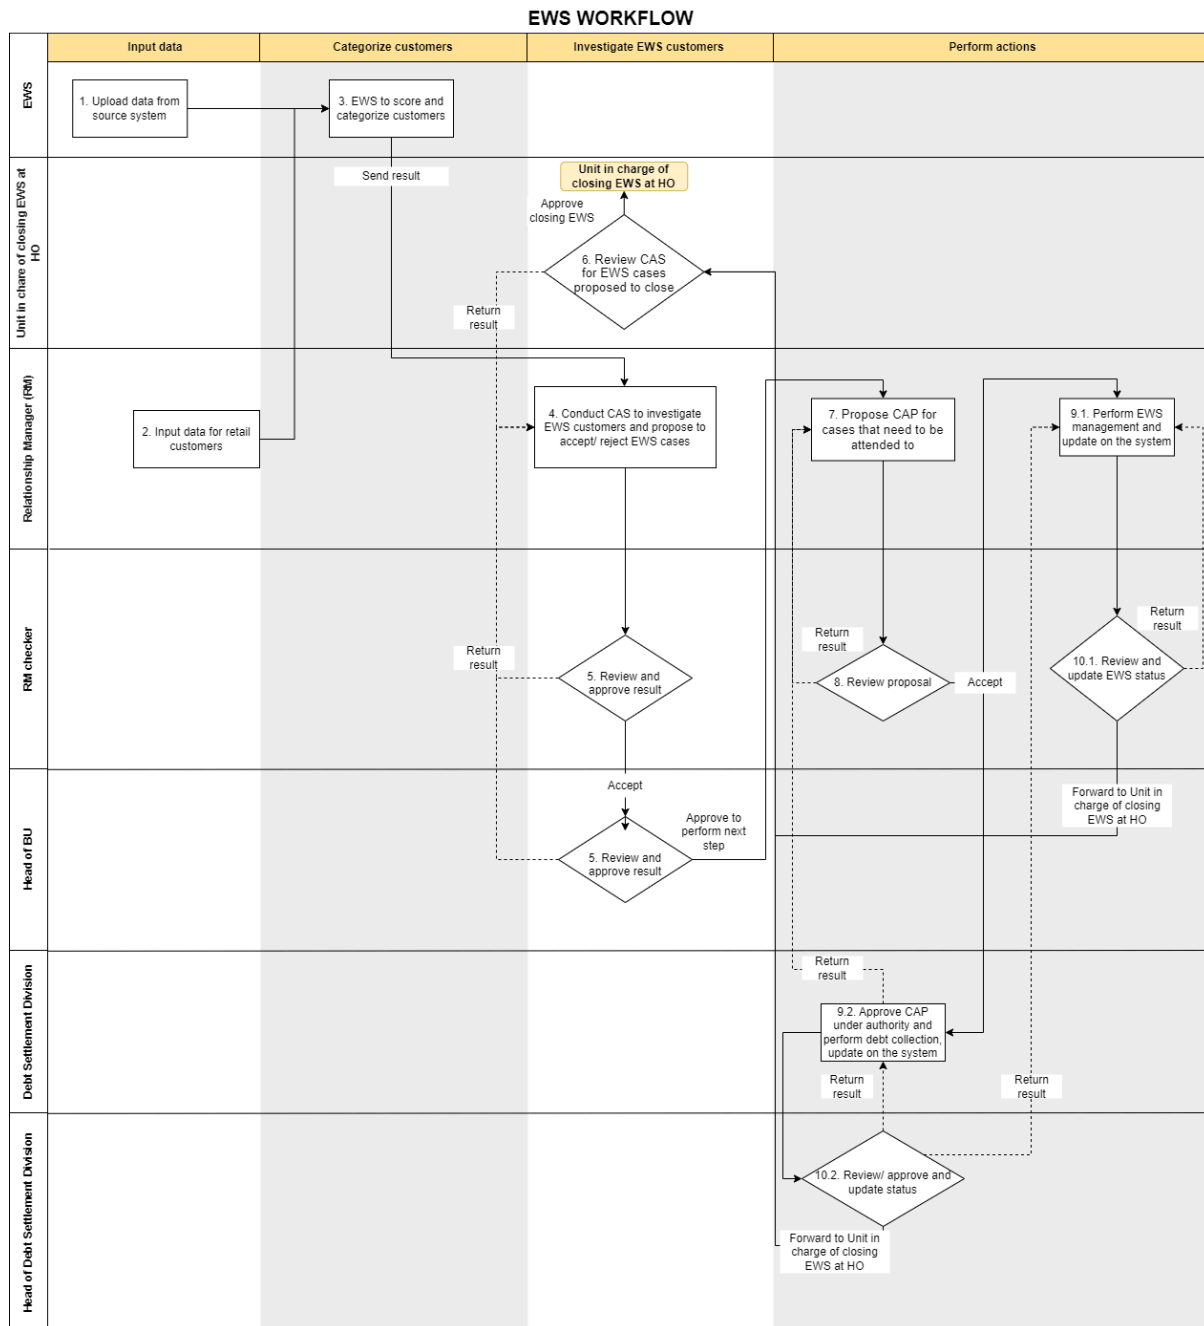

- Core Banking System
- Card System

2.1.1 Business Workflow

The following workflows, as submitted by EY have to be accommodated in the system. There are 2 separate workflows for retail customers and corporate customers.

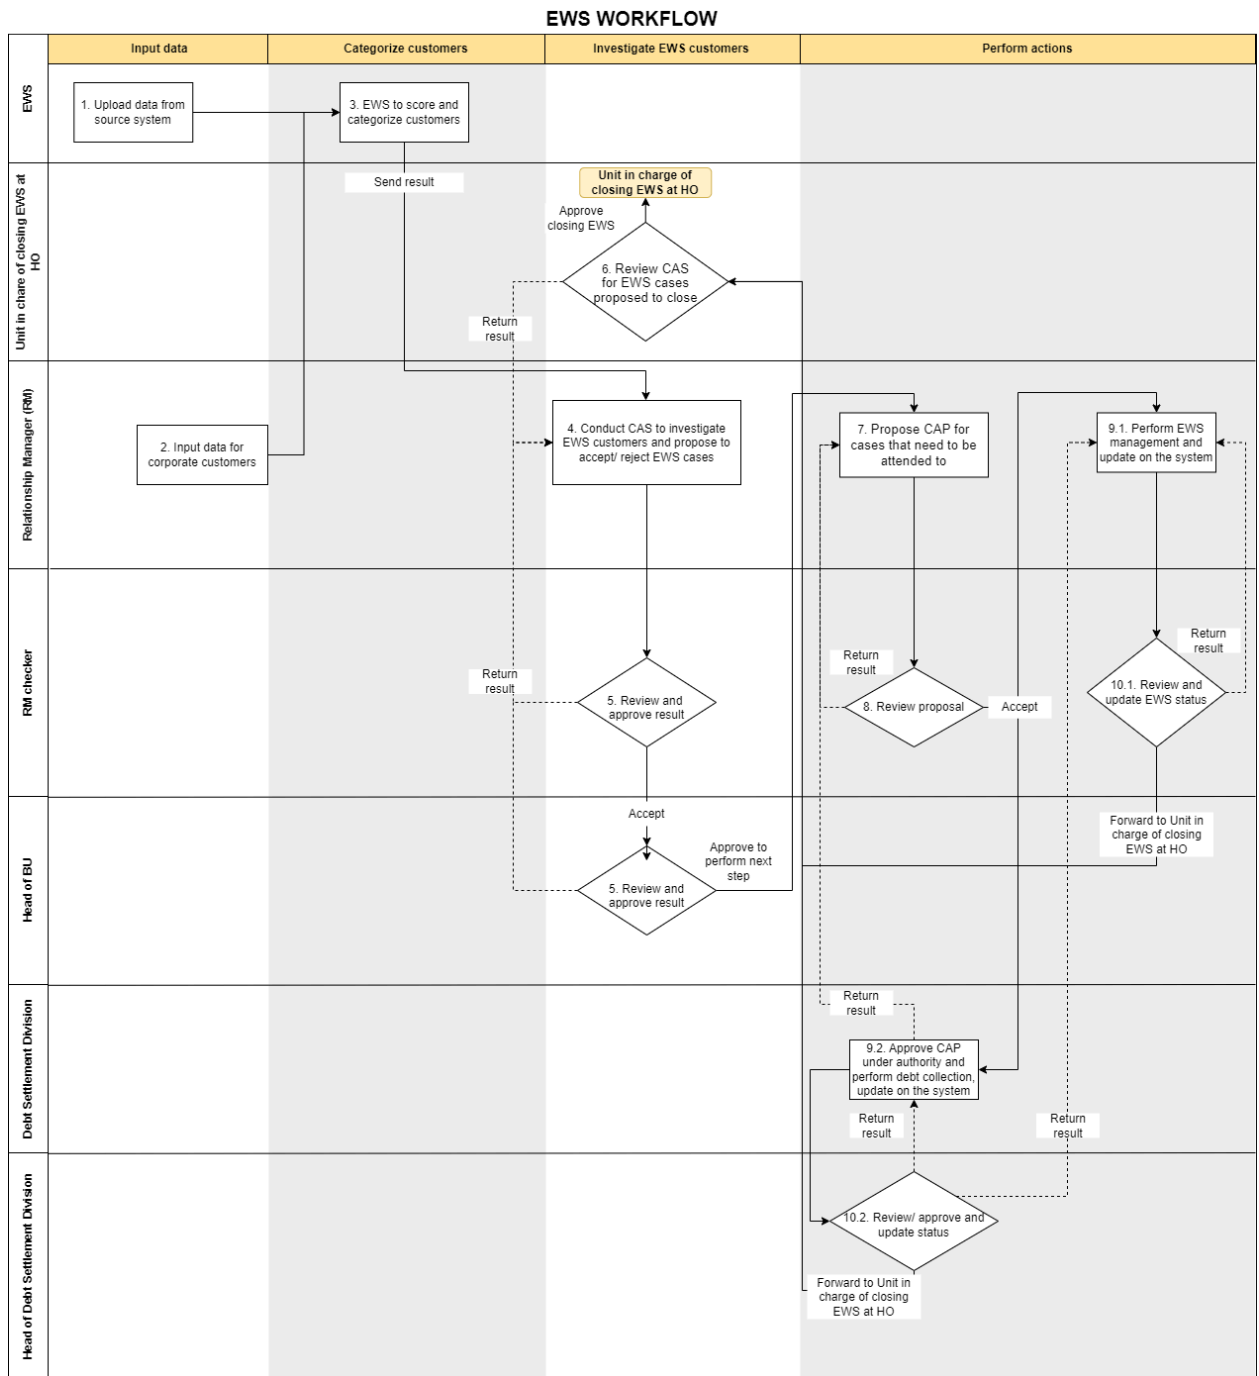

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

EWS workflow for retail customers:

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

EWS workflow for corporate customers:

For more details please refer to the attached BRD.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

2.1.2 System Interfaces

The EWS system is expected to be interfaced with Core Banking System and Card System of the bank.

Please refer the attached interface document to understand the data requirements of the EWS system.

Please note: Interface document attached in page 7.

2.2 Project Functions

Kalypto/EWS, the Early Warning Signals System designed by Care Risk Solutions Ltd. helps to systematically manage credit risk and helps in pre-emptive identification of stress for the entire tenure of the borrowers. Kalypto/EWS help banks/FIs to alleviate the risks of non-performing loans/assets by effectively using different categories of Risk Indicators to assess the account's health.

The system shall evaluate the configured triggers on a predefined frequency, and compare the data pertaining to borrowers' characteristics against the configured thresholds. If a trigger breach is identified then a case is created and it is presented to a bank official for further processing.

The bank official then is required to perform a Causal Analysis to find the cause of the trigger breach. If the trigger breach is deemed significant then the bank official can take the Case forward to the Corrective Action Plan stage.

Under the Corrective Action Plan, the bank official can decide to provide a corrective action which shall act to mitigate the risk identified by trigger breaches. The corrective action plan thus decided would be assigned to the selected users, which in turn would need to implement the action plan. Once all CAPs are implemented, then the case can be closed.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

3 Specific Functions

In the following sections, the modules of the system shall be described covering their functionality from an end-users perspective. This section describes all software functions at a sufficient level of detail for the users of the system to understand the system and its operability to identify EWS trigger breaches and their management.

3.1 Software Project Features

3.1.1 Purpose - Pre-emptive risk monitoring

From the loan asset portfolio, the companies / individuals which are under surveillance, shall be monitored with the help of configured risk indicators or triggers. Example: Maximum days past due (DPD) of the customer at the time of observation, etc. System shall track these configured risk indicators and generate cases if trigger breaches are identified so that pre-emptive action on such companies can be taken well in advance. If any breaches are identified by the system, then the violations are intimated through on-screen notification / email to designated set of users. The entire process can be run as per a pre-decided schedule or as and when necessary.

3.1.2 Dashboard

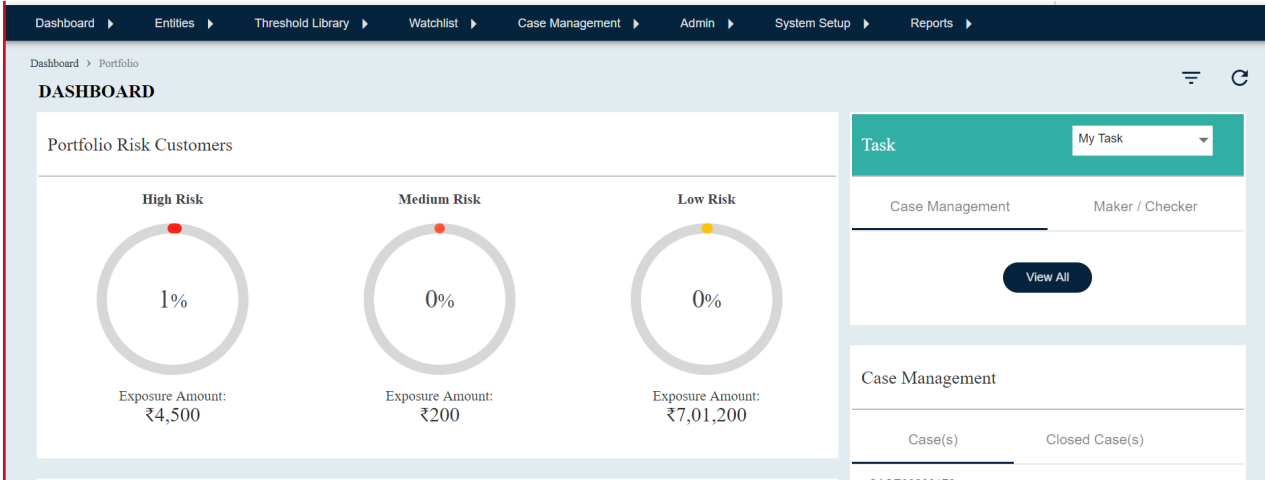

Dashboard is the landing page of the EWS system after the user logs in the system. It provides the summary of the overall performance of the borrowers. The widgets show all necessary information at a glance to the user assisting the user in their day to day tasks and decision making.

It contains:

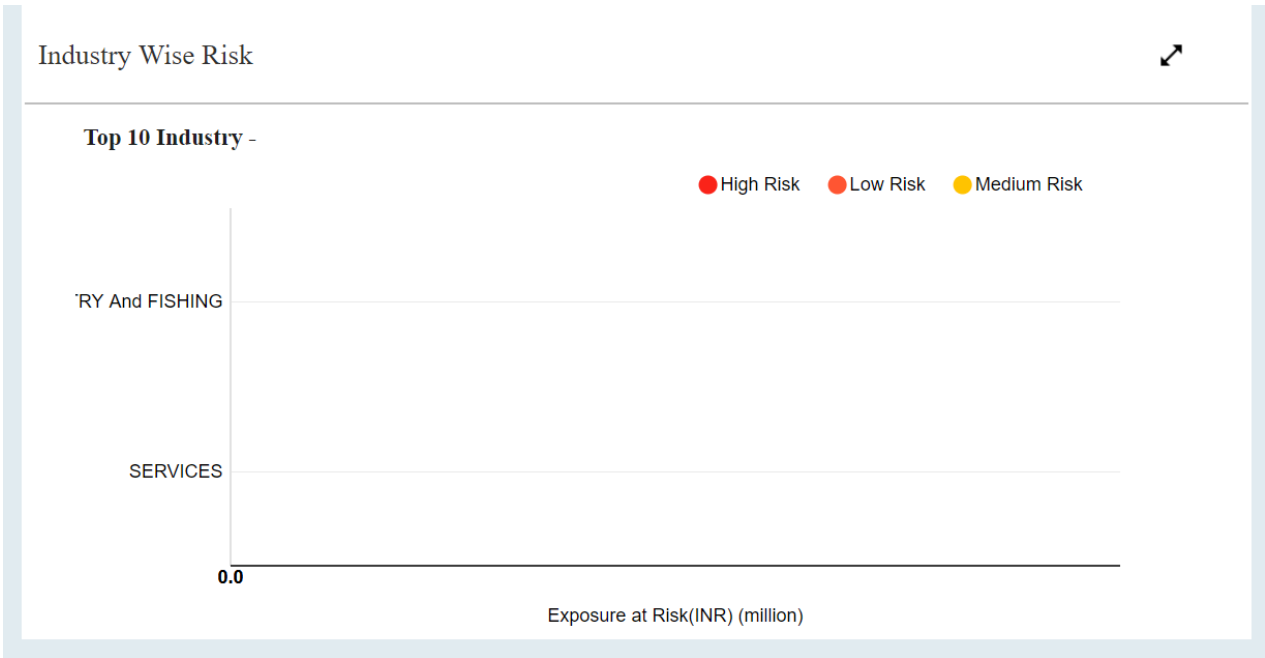

- Portfolio risk customers , this widget displays the borrowers that are categorized into high, medium and low risk, provided that there are cases on the borrowers
- Industry wise risk, this widget displays the top 10 industries that have breached the different types of risk parameters that have configured in the system
- Risk profile, this widget contains the count of the triggers breached as per their trigger category
- Frequently breached, this widget contains the triggers that are breached most frequently by the borrowers.
- Task widget, through this widget the user can access the case management and maker/checker tasks. Further this widget contains two types of tasks- My Task and Team Task.

Below are a few sample screenshots.

3.1.3 Entities:

Entities menu consists of the Borrower page.

3.1.3.1.1 Borrower -

The borrower page consists the list of all borrowers with complete details and history related to the borrowers. The borrower data can be captured through the core banking system, credit card system, and manually as well. A complete customer 360 for the borrower with all necessary information can be viewed in the borrower details page.

User can see the borrower details of any borrower by clicking on the borrower's names, after which a new page with all borrower details should open. User shall also be able to edit the borrower details by clicking on the 3 dots and then selecting edit.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

User can also, add a new borrower to the list, by clicking on the (+) plus icon the top of the screen, however, this is not recommended to be done any user except the system admin to maintain the sanity of data present in the system.

The borrower detail page for retail customers shall be different from corporate customers, given the data for both shall differ and the fields may not applicable mutually for both.

Path to Borrower page:

Entities > Borrower

Part 2 of 2

For BAC-A Bank, the Add Borrower page has been segregated as per retail and non-retail/individual customers.

3.1.4 Rule Library:

The EWS tracking is based on risk indicators or trigger which are configured in the system with applicable threshold limits. The configuration shall be allowed to system admin role. This activity is expected to be rarely used and changes can be made to the triggers as required by the admin or relevant users. Any changes to threshold value or addition of trigger (given necessary data points are available for setup) shall be tracked under maker checker concept. Any changes to threshold

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

value shall not impact the previously generated triggers. The changes shall be applicable post approval of checker.

Each risk indicator or trigger which is configured in the system is generally either financial or non-financial in nature. Configured risk indicator or trigger shall be computational or non-computational and require data to be sourced from various other systems and reports for their monitoring. Monitoring is highly dependent on the availability of required data. Data might be available/arrive at varying frequencies, example: daily, weekly, monthly, quarterly, yearly, etc.

The triggers which are financial in nature might require computational fields for their working. Non-financial triggers such as: A customer's family has someone who has a serious illness/severe illness/long-term hospital stay, the customer has used the loan capital for the right purposes, according to the business plan and investment project etc. shall utilize non-computational fields and data needs to be sourced or entered accordingly. Data authenticity is highly recommended for best results and avoiding false breaches/alarms.

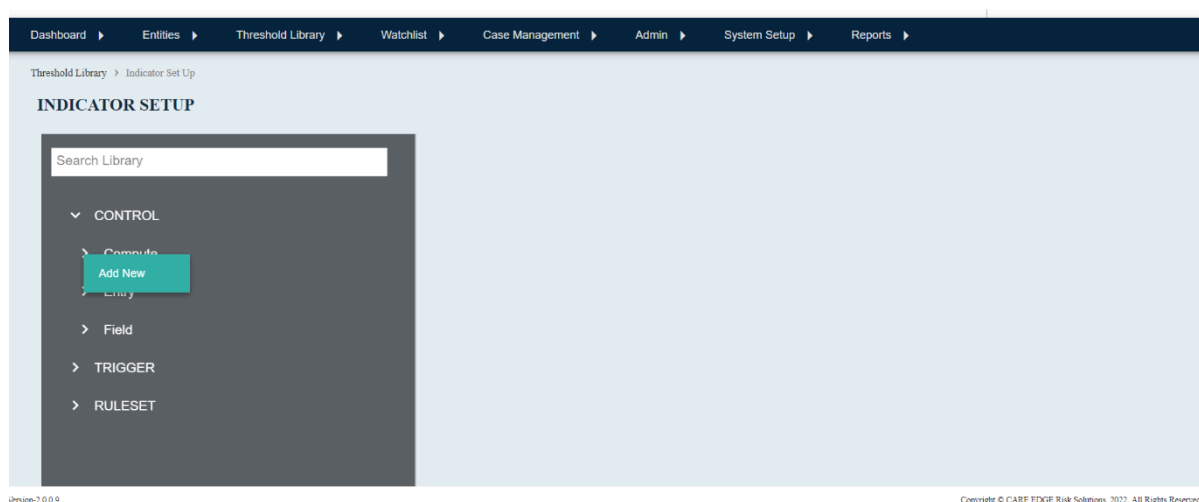

Adding new Event:

Adding a new indicator / trigger can be done from the system itself without changing the background system code given necessary data points are available in system.

Data points available in any system of the bank shall be interfaced and brought to the EWS system as per the scope of the implementation. Based on the frequency of availability of data the triggers / indicators shall run. Example: if the data is available on a daily basis, the triggers utilizing those shall run on a daily basis.

Data can be feed into the system in 2 ways:

- Data can be interfaced from a Bank's system
- Data can be entered manually: Manual file upload or manual data entry (key-in)

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

Setup of indicators is done by the user with the help of the Indicator Setup under Rule Library (Path: Dashboard □ Threshold Library □ Indicator Setup).

Under Indicator Setup, there are 3 sub menus which are used to setup a new indicator / trigger in the system, these are:

- **Control**

Here the placeholder which would be used to store the data for monitoring risk indicators or triggers are configured. This is further done in 3 categories:

- Compute: This holds the data which is obtained after performing some required calculation, Example: Total Debt (i.e. Compute Field) = Total Current Liability (Field)+ Total Noncurrent Liability (Field).

Information like Field Name, Field Category (System or Manual), Field Type (Entry or Compute or Field), Type (Text, Number, Boolean, Date), Frequency (Daily, Weekly, Monthly, Quarterly, Semi Annually, Annually), Validator, Default Value, Process Type, Tool Tip, Description, etc. are captured on this screen.

The computational logic for calculation of the final value is also set up here under Compute Details section. The compute details section further has Conditions and Filter. Under Conditions section, the logic for calculation of the final data point is set up.

- Entry: This holds the data which is static in nature and change might not be required. Example: No. of days in a year = 365. Information similar to what is captured under compute is captured here, like Field Name, Field Category (System or Manual), Field Type (Entry or Compute or Field), Type (Text, Number, Boolean, Date), Frequency (Daily, Weekly, Monthly, Quarterly, Semi Annually, Annually), Validator, Default Value, Process Type, Tool Tip, Description, etc.

- Field: This holds the data which is obtained from other systems which is then further used by the system for material event setup/trigger setup. Example: PAT sourced from financial results. Information similar to what is captured under compute is captured here, like Field Name, Field Category (System or Manual), Field Type (Entry or Compute or Field), Type (Text, Number, Boolean, Date), Frequency (Daily, Weekly, Monthly, Quarterly, Semi Annually, Annually), Validator, Default Value, Process Type, Tool Tip, Description, etc.

- **Trigger**

Here, rules for trigger/risk indicator are setup. The triggers/indicators can be further classified into trigger categories as per their risk type.

Following information about the trigger is captured while its setup under Basic Details Section – Trigger Name, Product Category, Frequency (Daily, Weekly, Monthly, Quarterly, Semi Annually, Annually), Trigger Category (Account Conduct, Financial Risk, Management Risk, Business Risk etc.), Score, Trigger type, Trigger On/Off, Effective till date, Trigger Sub Type, Description, etc.

The screenshot displays the 'INDICATOR SETUP' interface. On the left, there is a 'Search Library' input field and a sidebar menu with 'CONTROL' expanded, showing 'Compute' as a sub-option. The main area is titled 'Add Control Setup'. It contains two input fields: 'Field Name *' with the value 'abc' and 'Field Type *' with a dropdown menu showing 'Compute' as the selected option.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

Part 1 of 2

Part 2 of 2

After filling in the details and clicking on next, conditions required for monitoring the trigger is setup under Conditions Section.

Part 1 of 2

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

Part 2 of 2

For setting up the ruleset, details regarding the ruleset is to be filled under the Indicator Ruleset section. Details like, Name, Customer Type, Industry, Sub Industry, Segment, Description, Debt group etc. After entering the details, the previously setup (from the previous steps) triggers/risk indicators have to be selected (check marked) which are to be added under the particular ruleset.

Once a ruleset is created, the threshold values can be set by right clicking on an indicator and then selecting EDIT. After which, under the Indicator Threshold Section: 1. Basic Details 2. Conditions 3. Filter 4. Risk/Score can be setup.

Under Risk/Score setup, individual threshold values as per risk type i.e. High, Medium, Low Risk can be setup. Data type (Text, Number, Boolean, Checkbox), Operators (Ex. >, <, =, %, etc.) and Value for each threshold value has to be recorded.

Scoring needs to be given at Threshold level (inside ruleset), where at each level of threshold (high, med and low) the score can be set by the admin.

Weight for a trigger needs to be set at rule set level (inside ruleset). The sum of all trigger weights inside ruleset should be equal to 1 (validation rule).

If user does not provide weights for any trigger, then the system should provide equal weights to all triggers. Weight in this scenario = 1/no. of triggers

Final Risk Score for a breached counterparty = (Score of breached trigger 1 * Weight of breached trigger 1) + (Score of breached trigger 2 * Weight of breached trigger 2) + + (Score of breached trigger n * Weight of breached trigger n)

Highest Risk Score for a counterparty = (Score of trigger 1 for High Risk * Weight of trigger 1) + (Score of trigger 2 for High Risk * Weight of trigger 2) + + (Score of trigger n for High Risk * Weight of trigger n)

Final counterparty risk score needs to be shown along with the highest possible score risk score for a ruleset at the "Triggered Account" page in the EWS system.

Information on ruleset also needs to be shown, score needs to be shown along with ruleset as there could be multiple rulesets applicable on a counterparty.

Modifying Risk Indicators/Triggers:

For risk indicators/triggers which have already been configured in the system, there is a functionality to edit them if such need arises. If one right clicks on the labels, menu for EDIT, DELETE, VIEW opens, from which the data already saved can be edited. This functionality is available for all the setups under: Control (Compute, Entry and Fields), Trigger and Ruleset.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

After selecting EDIT, the user can then edit previously saved data as per need.

Document ID	

Part 3 of 4

The screenshot displays the 'INDICATOR SETUP' interface. On the left is a 'Search Library' sidebar with a list of categories: CONTROL, TRIGGER, RULESET, checking Delete, sojal Testing, Corporate, daminiRul, DC, DCCB_RULESET00000026_DELETE, and ddadad. The main area is titled 'Edit Indicator Threshold' and shows a configuration for '4 Risk/Score'. It includes a 'Trigger weight' field set to 12. Below this is a table-like structure with two rows: 'Risk Type' (Medium Risk) and 'Risk Score' (12), and 'Data Type' (Text) with 'Operators *' (Between) and 'Value *' (12). Each row has a plus (+) or minus (-) button for adjustment.

Part 4 of 4

Maker – Checker and SLAs:

All the additions, changes or deletions made in the EWS system is governed by a 2-step process for those actions to be actually implemented or enabled in the system.

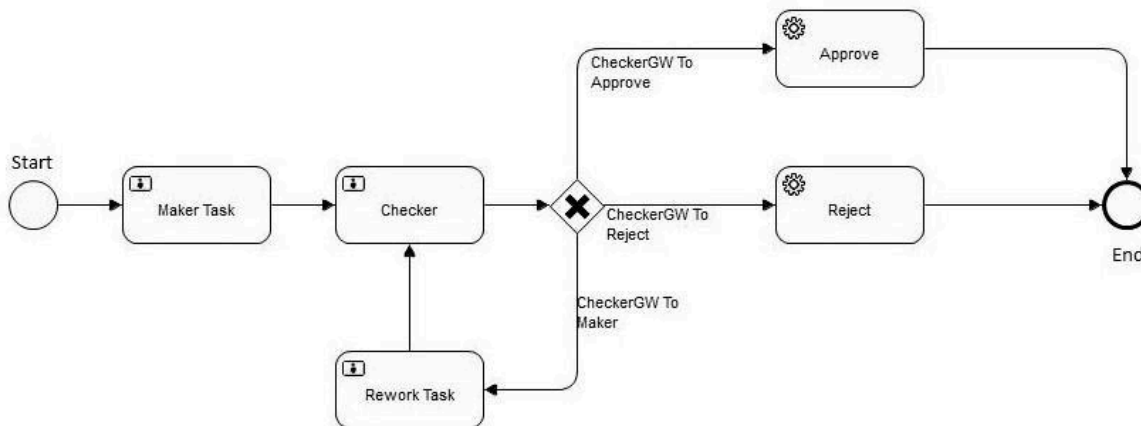

In the system, the 1st step would be to make the changes in the system. The person who makes the changes is designated as maker. Any time a change is made to the system its state will be registered as active in the system, but for the changes to be reflected in the system the state needs to be changed from “is active” to “is enabled” in the system. The state is changed to is enabled once the checker approves of the changes (additions/edits/deletions) made by the maker.

The 2nd step involves those changes to be accepted or checked by another user, possibly from a higher hierarchy (checker). The checker can also indicate maker to rework the task. If this happens, the 2 step process repeats.

For instance, the additions or changes to indicators / triggers can be performed by one user of a particular role and the changes can be checked by a user of another role. These roles shall be configured in the system using SLA Configuration where the Contributors and Participants shall be assigned as task actors. Contributors are those who would actually do the task assigned and Participants are those who can just view the task being performed.

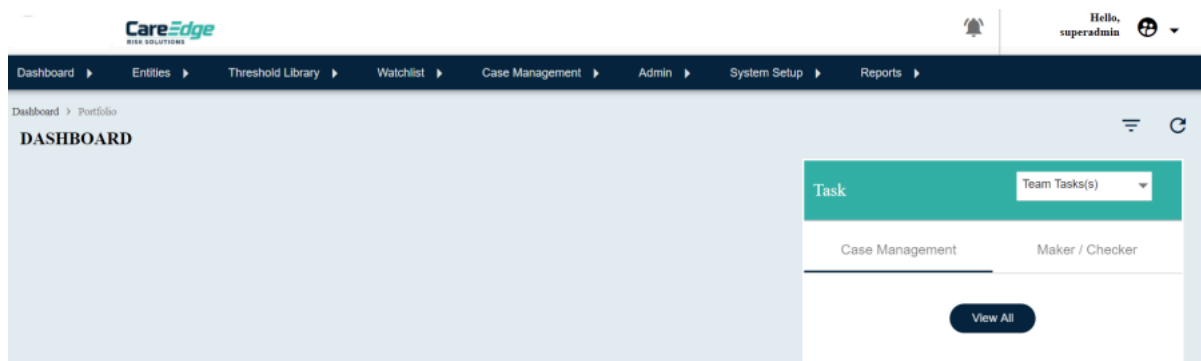

Under SLA Configuration timelines for a particular task can be set as SLA Start Time and SLA Cut-Off Time. If the tasks are not completed in time, then system notifications can be sent to relevant task actors.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

Maker Checker process is also applicable to case workflow – CAS, Causal Analysis Stage and CAP, Corrective Action Plan. The workflow in the system needs to be changed in order to accommodate the workflow required by the bank. Please refer the workflows attached in the above sections.

All task related to Maker – Checker are accessible through the primary dashboard from where user can directly access and go to the chosen task.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

3.1.4.1.1 Breach Tracking:

Post configuration of indicators in the system, the rule engine shall track each indicator based on frequency and availability of data. While tracking if any anomalies are found then it will result in breach of indicator. These breaches are also called as Trigger Breaches. Breaches are indication of a non-acceptable situation or a not favorable situation. These breaches are generated based on risk indicators / triggers /rules as configured in the system.

Each configured events are applicable to certain type of counterparties such as Retail or Corporates. Rule engine shall pick only applicable events for these counterparties then do data verification. During data verification, engine shall pick only those events for which the data is available.

The data received for these companies shall be measured against the applied threshold values and if there is violation, then a trigger or breach will be generated.

Trigger Score:

Each trigger / indicator while configuring in the system, will need to have a score associated for High Risk, Medium Risk, Low Risk & No Risk. These scores will be used to compute EWS score for the counterparty for which Case has been generated. Weights can be assigned to the triggers in a ruleset. Based on the risk scores and weights of the triggers the scores are assigned to a case.

Sum of all weights of triggers in a ruleset needs to be equal to one. If the weights are not assigned to triggers in a ruleset, then triggers should be assigned an equal weight.

EWS Score of a Case = Sum of ((weight of trigger 1 * risk score as per breach) + (weight of trigger 2 * risk score as per breach)+ + (weight of trigger n * risk score as per breach))

Change of EWS score:

Till the time Case is not closed, new triggers will also be parked under same case therefore the EWS score might increase, if new triggers are breached.

Functionality to override a trigger is also available which might also result in a change of the score of a case.

On 01-Oct-2022, case was generated having EWS score as 30 because of 3 breaches. On 02-Oct-2022 one more breach has happened therefore EWS score will be over written with new value of 40, assuming each trigger breach has a score of 10 and all triggers are equally weighted.

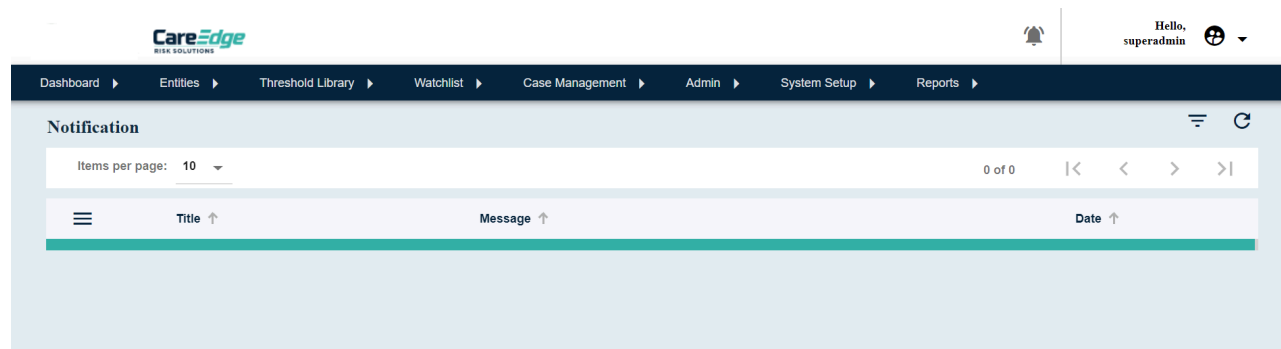

Notifications:

In System there shall be two types of notification on-screen and e-mail notifications.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

Onscreen Notification:

Logged in authorized users (bank users) will get notification on dashboard, displaying pending action items

Email - notification:

Authorized users (bank users) need to be notified via e-mail whenever a task is generated in the system or whenever action is required by a case generated. The e-mails utilized in user master shall be utilized to send the mail notification.

3.1.5 Case Management:

Case Management is third part of system and it is bigger part. The Case will come in effect when the rule engine has identified breaches (alert).

CASE: A Case is an encapsulation for all breaches pertaining to a single counterparty. Under each Case there might be one or more breaches. Most of the times each company shall have one active Case if breaches have been identified. For all the breaches which are detected, the tracking will be done at Case level instead of individual breach level.

The Case needs to follow the workflow presented in the earlier section of this document. The workflow for retail customers for the bank shall be different than the workflow for corporates. Both the workflows have been prepared by EY in accordance with the Bank.

One company can have multiple breaches getting generated over the course of time. Once breach is generated, system shall

- 1) Search if there is active case then park breach inside active case
- 2) If no active case, system shall generate new case and park this breach inside the generated case

Case details page:

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

When the designated user decides to check the details about the generated case, he/she has to select the case from dashboard. Once it is selected, system will take user to detail page which is as below.

On this page the detail about Case will be displayed having all the required sections to provide the details about the case and the counterparty.

Each case shall be assigned to designated user as mapped within the system. System shall do auto allocation of case to the users. Post allocation of case to user, system shall also intimate the user using e-mail about allocation of case.

The table below contains detail about each field shown on this page.

Case Detail Data Field Table:

From the same page the user can switch to other tabs i.e. Triggered Indicators/Accounts, CAS Section, CAP Section, CAP Implementation for the same Case.

Triggered Events/ Accounts:

Under this tab the user will be able to see all the trigger breaches which caused the case to be generated. The user will be able to see the details associated with each of trigger breach such as: Trigger Name, Trigger Category – telling which category trigger belongs to E.g. Financial Risk, Management Risk, etc., Frequency – telling the frequency of monitoring, Threshold Value, Breach Value, Risk Category – E.g. High, Medium, Low., Trigger Score, Trigger Period, Created By, Created

BAC A Bank - EWS	Version: 1.0

CAS Section:

Under this tab, the user will be able to access the causal analysis which is required for the particular case. Under causal analysis, the user determines the cause and severity of the trigger / indicator breach which was generated by the system.

After undertaking causal analysis, the case can either be closed and terminated if the case is not severe or can further be proceeded to formation of a corrective action plan (CAP). Causal analysis reports can also be downloaded from the same page under the attachment header.

The processes shall be as per the workflow suggested by EY as per bank's requirement. The workflow shall also include Maker – Checker Process, where once the CAS is completed by a user, the other set of users (Rm checker, Head of BU) has to approve and review the CAS undertaken. If CAS is accepted, then case shall either be closed or shall be proceed to CAP formation stage. If CAS is not accepted, then CAS has to be reworked by the designated user.

An audit trail will be captured automatically by the system for the CAS, capturing the activity history of the user working on CAS, time stamp with regards to these activities will also be captured along with comments and outcome.

CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

3.1.5.1.1 Notification Management:

Alerts shall be generated and managed by the notification engine of the EWS. This section primarily covers the notification event, format of the email notifications and other required details.

3.1.5.1.2 Workflow

3.1.5.1.3 Email Notifications

1) Case generation intimation

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

If there is violation is observed in received data vs. configured threshold for the configured events in the system, then the system will generate breaches under existing case or create new case if no case is pending for the company at hand. This would be intimidated to the relevant stakeholders, via dashboard notifications and also via email. The EWS dashboard/email notifications will be sent only when new case is getting generated, any further breaches to the existing case would be added to the previous case itself. In the system, Case creation could be manual as well.

From Email ID: EWS_Monitoring@Dummymail.com

Subject: NEW CASE for \$COUNTERPARTY_NAME\$ | CASE ID: \$CASE_ID\$

Dear \$USER_NAME\$

Indicator breaches have been observed by EWS system for \$COUNTERPARTY_NAME\$ having computed EWS score as \$EWS_SCORE\$. Please address within due timelines to avoid escalation.

Thanks,
EWS Team

2) Case Escalation intimation

After the case is generated, if the case is left unattended and no action is taken upon the case in the stipulated time frame then the case is escalated by one level in the seniority in the organization/department. This escalation notifies the immediate senior and the existing assigned person, via an email of the pending action so that the person responsible for the case can be nudged to do appropriate tasks required. This shall work for both, Causal Analysis Report and Corrective Action Plan.

From Email ID: EWS_Monitoring@Dummymail.com

Subject: Case Escalation for \$COUNTERPARTY_NAME\$ | CASE ID: \$CASE_ID\$

Dear \$USER_NAME\$

Case escalation has been observed by EWS system for \$COUNTERPARTY_NAME\$ having computed EWS score as \$EWS_SCORE\$ due to non-completion of tasks within deadlines. Please address the case as soon as possible.

Thanks,
EWS Team

3) Case Closure intimation

Once all the pending CAPs have been implemented for the particular case, the case will be closed in the EWS system. After the closure of the case an email and a dashboard notification will be sent on email Id to the relevant users associated with the case notifying of case closure.

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

From Email ID: EWS_Monitoring@Dummymail.com

Subject: Case Closure for \$COUNTERPARTY_NAME\$ | CASE ID: \$CASE_ID\$

Dear \$USER_NAME\$

The case generated by EWS System for \$COUNTERPARTY_NAME\$ which had an EWS score of \$EWS_SCORE\$ has been closed.

Thanks,
EWS Team

Working

The email notifications will be originated from within the EWS system and will be delivered in the inbox of the intended recipient at occurrence of 3 events i.e. Generation of a New Case, Escalation of an unattended/delay in working for a case and Closure of a case.

3.1.6 Admin:

Admin page allows the management of data, parameters and other processes which are essential to run the EWS system.

3.1.6.1.1 Process management:

Process management allows to run all the process that are required to run to generate reports, execute rule library, process data etc.

For Eg: Reports once configured in the Parameter management > Reports configuration page, it can be run in the process management page, once the reports are run all the reports will be generated to the respective users as configured.

Path to Process management page:

Admin > Process management > Process

Process management listing page:

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

S/N	Process Name
1	Actuator Metrics
2	Asset Quality Index
3	Compute Field
4	Counterparty Product Mapping Incremental Data Handling
5	Counterparty Staging to Master Handling
6	Ensure Data Staging to Master Handling
7	Extract and Load data

3.1.6.1.2 Parameter management-

Parameter management allows the user to manage the system masters in the EWS platform.

Under parameter management > maintainable - The page consists of product category, parameters, report configuration.

Under parameter management > Non- maintainable - The page consists of category, parameters, product, holiday list and system properties.

There are two sub-menus under the parameter management menu:

- **Maintainable** - Maintainable page allows the user to manually configure the masters, parameters and etc. in the EWS system.

The admin can configure parameters for a category in the parameters tab, these parameters will reflect with the category in the respective pages. For Example: Credit card is configured as a parameter in the product category, hence credit card will reflect in the product category drop-down in borrower page and all other pages where product category is present.

- **Non- maintainable** - A client has the option to auto set-up the category/masters, parameters, products and etc. based on the data interfaced from banks systems like core banking system and other banking systems.

The categories act as dynamic system masters in the EWS system and whereas the parameters act as entries in the masters

Path to Maintainable page:

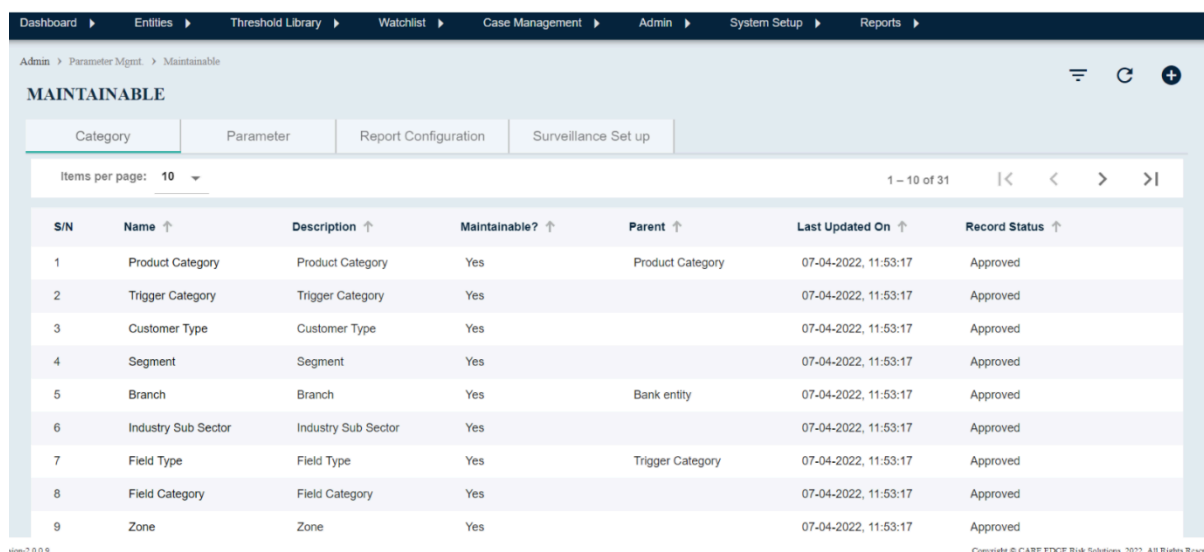

Admin > Parameter Management > Maintainable

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

3.1.6.1.3 Category Tab:

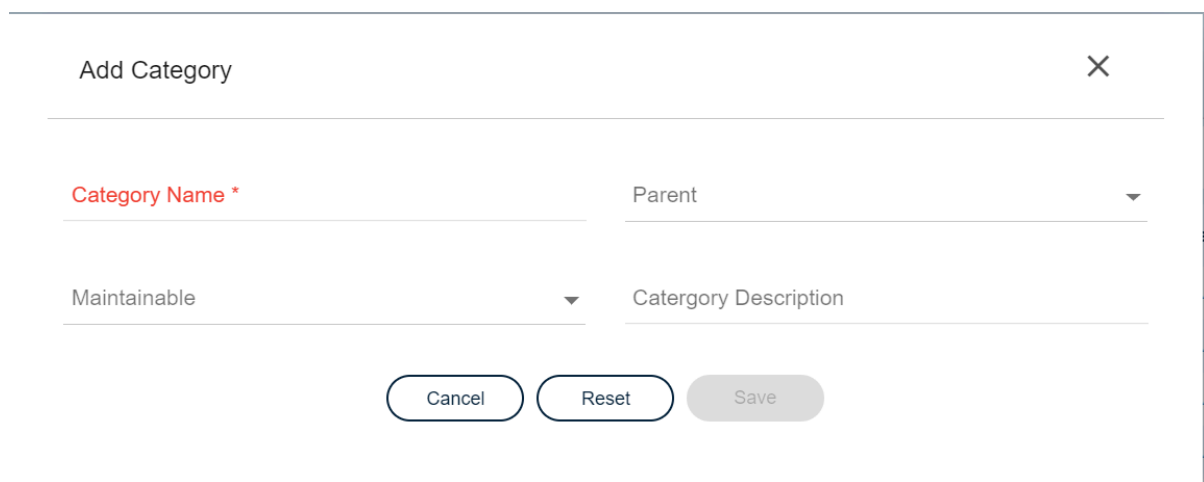

Category are the masters/ key data fields in the system's pages under which parameters/values can be added. Category and parameters work on a key value pair basis where categories are the keys and parameters are the values.

Maintainable listing page for category tab:

S/N	Name ↑	Description ↑	Maintainable? ↑	Parent ↑	Last Updated On ↑	Record Status ↑

3.1.7 Security Admin:

Security admin menu serves the purpose of setting up roles and access for the users, it also allows to maintain certain boundaries for the users to maintain an appropriate level of security.

Under Security admin menu there is the User management tab which contains all the role/access setup options/tabs for the user, like:

- User setup
- Role setup
- Role menu setup
- User role setup
- User team setup

Please note: Security admin menu needs to be renamed as System setup.

3.1.7.1.1 User Setup-

User setup will allow to setup the access for users, after filling in the required details needed by the system a user is created in the EWS, thus he can login in the system.

Path to enter the User setup page:

Security admin> User management> User setup

Below details are required in the add role set-up pop up, all fields are mandatory:

- Role Name
- Screen expiry time in seconds

3.1.7.1.3 Role Menu Setup

The role menu setup page serves the purpose of providing access of the menus/submenus to the user in regards to his/her role.

Role menu setup page:

Role menu set up page contains the select role and select menu options where select role contains the list of all roles that are present in the system like – RM, AGM, Credit head, BU head etc. Select menus contain all the menus/sub-menus that are present in EWS.

For Eg: Access of particular menus of the system can be provided to a Relationship manager role, and a superadmin role can be provided access to different menus than the other roles.

Based on this configuration access to systems menus can be governed for users of a particular role. This helps in configuring the access rights of the users in the system.

3.1.7.1.4 User Role Setup:

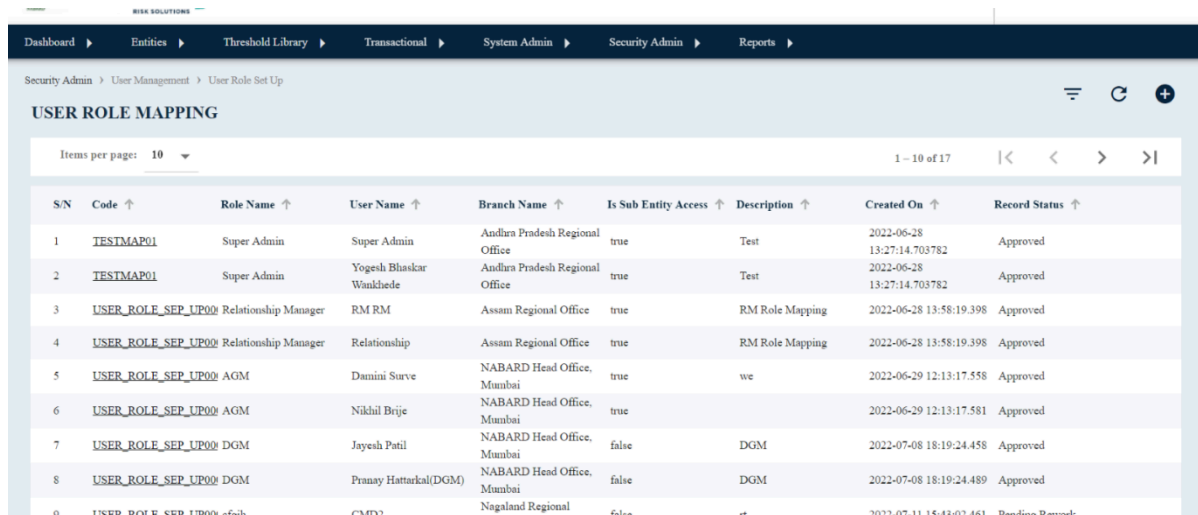

User role setup allows to map the user with his/her respective role and branch.

Path to enter User Role setup page:

3.1.8 Reports:

EWS allows to generate different types of automated reports based on user configured frequencies, EWS fetches the data from the core banking system, credit card system and other sources, based on the data fetched the EWS processes the data and as per the outcome the reports are generated in the system.

The system allows selecting a timeline for extracting reporting data. The system may limit the amount of time it takes to extract data depending on the volume of data.

Eg: The user can generate a report for open cases for the time period of 01 January 2022 to 01 March 2022

3.1.8.1.1 System reports:

System reports are the automated reports generated on regular intervals. Reports are accessible as per the users' role configured at reports configuration page.

Path to enter System reports page:

Reports > Canned reports > System reports

System reports listing page:

Dashboard ▾ Entities ▾ Threshold Library ▾ Watchlist ▾ Case Management ▾ Admin ▾ System Setup ▾ Reports ▾

BAC A Bank - EWS	Version: 1.0
CRS-QMS-FMT 012-FUNCT. USER MANUAL - BAC A EWS	Date: 11-Jan-2023
Document ID	

The system allows audit trails for all users and related activities (input, edit, review, approve, adjust categorization), as a separate report.

3.1.8.1.2 Custom Reports:

Custom reports are those reports which are created manually, the template and content are decided by the user.

Ad-Hoc Report Query-

Ad hoc report query allow the user to get reports (Excel, PDF, CSV formats) through SQL queries which are connected with the Related Data Base Management System (RDBMS) of the EWS system.

Path to enter Ad-Hoc report query page:

Reports> Custom reports > Ad Hoc report query

Below mandatory details are required in the Ad hoc report query page:

- Type your query in the field box- This a placeholder to type SQL queries
- File Name – User entered report name
- File Extension- Format in which the report would be downloaded
